

# Reading Set 1

---

Kaulla Tengan

Due by 10pm ET on Monday

## Reading Set Information

A more thorough reading and light practice of the textbook reading prior to class allows us to jump into things more quickly in class and dive deeper into topics. As you actively read the textbook, you will work through the Reading Sets to help you engage with the new concepts and skills, often by replicating on your own the examples covered in the book.

*These should be completed on your own without help from your peers.* While most of our work in this class will be collaborative, it is important each individual completes the active readings. The problems should be straightforward based on the textbook readings, but if you have any questions, feel free to ask me!

## GitHub Workflow

1. Before editing this file, verify you are working on the copy saved in *your* repo for the course (check the filepath and the project name in the top right corner).
2. Before editing this file, make an initial commit of the file to your repo to add your copy of the problem set.
3. Change your name at the top of the file and get started!
4. You should *save*, *knit*, and *commit* the .Rmd file each time you've finished a question, if not more often.
5. You should occasionally *push* the updated version of the .Rmd file back onto GitHub. When you are ready to push, you can click on the Git pane and then click **Push**. You can also do this after each commit in RStudio by clicking **Push** in the top right of the *Commit* pop-up window.
6. When you think you are done with the assignment, save the pdf as "*Name\_thisfilename\_date.pdf*" before committing and pushing (this is generally good practice but also helps me in those times where I need to download all student homework files).

## Gradescope Upload

For each question (e.g., 3.1), allocate all pages associated with the specific question. If your work for a question runs onto a page that you did not select, you may not get credit for the work. If you do not allocate *any* pages when you upload your pdf, you may get a zero for the assignment.

You can resubmit your work as many times as you want before the deadline, so you should not wait until the last minute to submit some version of your work. Unexpected delays/crises that occur on the day the assignment is due do not warrant extensions (please submit whatever you have done to receive partial credit).

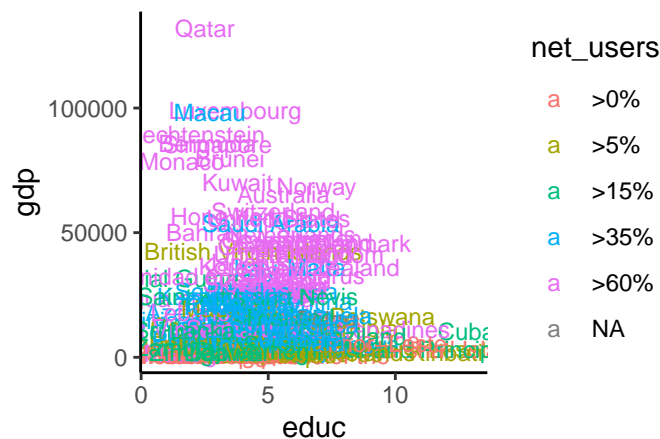

## Problem 1 GDP and education

- 1.1 Figure 3.3 in Section 3.1.1 shows a scatterplot that uses both location and label as aesthetics. Reproduce this figure. *Hint: you'll need to define 'g' based on code from earlier in Section 3.1.1. Also, make sure you load packages in the setup chunk as needed!*

```
data(CIACountries)

# define the plot object
g <- ggplot(data = CIACountries, aes(y = gdp, x = educ))

# print the plot
g + geom_text(aes(label = country, color = net_users), size = 3)
```

- 1.2 Now, update the plot with more informative labels. Label the x-axis “% of GDP spent on education” and the y-axis “Gross Domestic Product (GDP)”. *Hint: see Section 3.2.1 for an example of one way to label the axes.*

```
g2 <- ggplot(data = CIACountries, aes(y = gdp, x = educ)) + labs(x = "% of GDP spent on education", y = "Gross Domestic Product (GDP)")
g2 + geom_text(aes(label = country, color = net_users), size = 3)
```

- 1.3 Next, move the legend so that it's located on the top of the plot as opposed to the right of the plot. *Hint: see Section 3.1.4 for an example on how to change the legend position.*

```
g3 <- ggplot(data = CIACountries, aes(y = gdp, x = educ)) + labs(x = "% of GDP spent on education", y = "Gross Domestic Product (GDP)")
  theme(legend.position = "top")
g3 + geom_text(aes(label = country, color = net_users), size = 3)
```

- 1.4 Lastly, Section 3.1.2 discusses *scale*, and demonstrates how to display GDP on a logarithmic scale to better discern differences in GDP. Update the figure so GDP is on a log10 scale.

```
g4 <- ggplot(data = CIACountries, aes(y = gdp, x = educ)) +
  theme(legend.position = "top")
g4 + geom_text(aes(label = country, color = net_users), size = 3) + labs(x = "% of GDP spent on education", y = "Gross Domestic Product (GDP)")
```

## Problem 2 Medical procedures

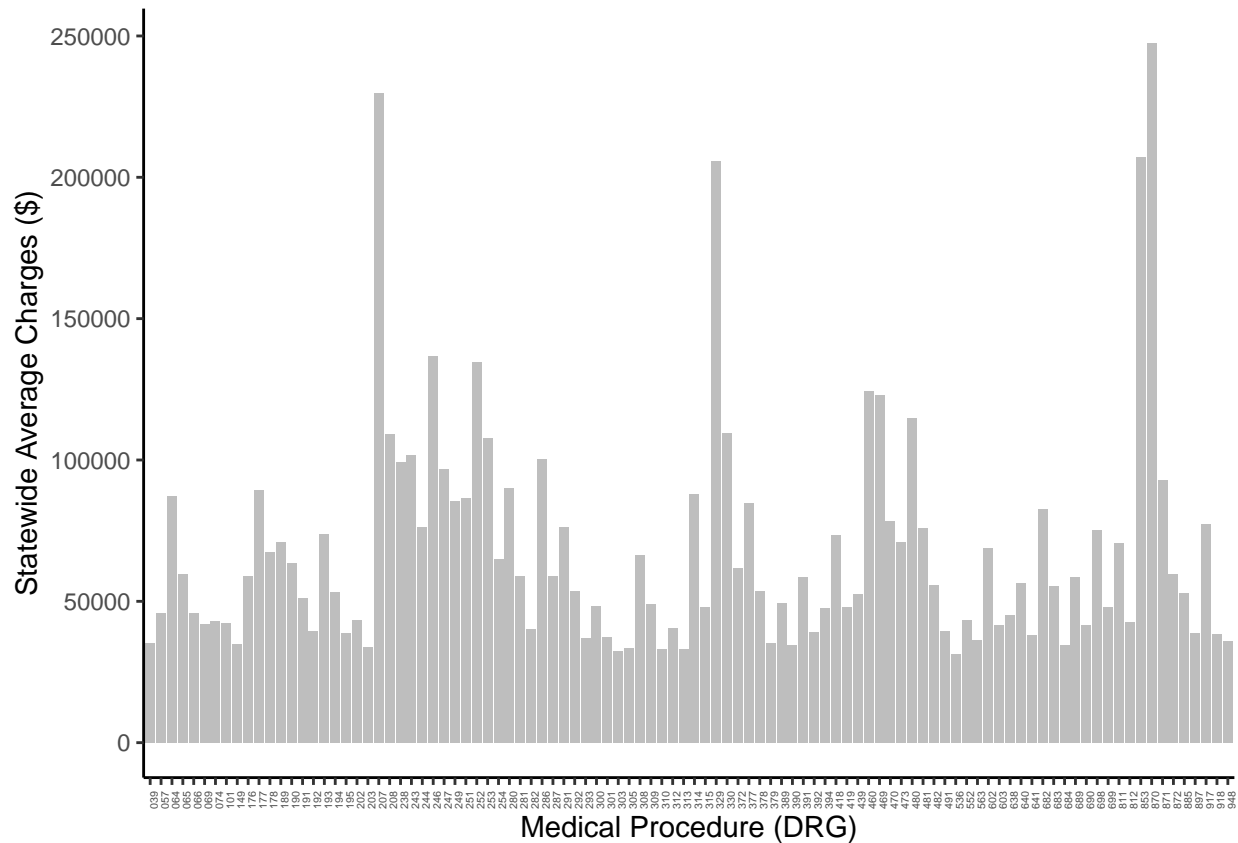

- 2.1 Consider Figure 3.8 in Section 3.1.5. What does `reorder(drg, mean_charge)` do? To figure this out, recreate the plot, but use `x = drg` instead of `x = reorder(drg, mean_charge)`. What happens?

the `x = drg` puts the x values in order of numerical order, while `x = reorder` function, puts the x values in order of mean charge ascending.

```
data(MedicareCharges)
ChargesNJ <- MedicareCharges %>%
  ungroup() %>%
  filter(stateProvider == "NJ")

# create the plot object
p <- ggplot(
  data = ChargesNJ,
  aes(x = drg, y = mean_charge)
) +
  geom_col(fill = "gray") +
  ylab("Statewide Average Charges ($)") +
  xlab("Medical Procedure (DRG)") +
  theme(axis.text.x = element_text(angle = 90, hjust = 1, size = rel(0.5)))

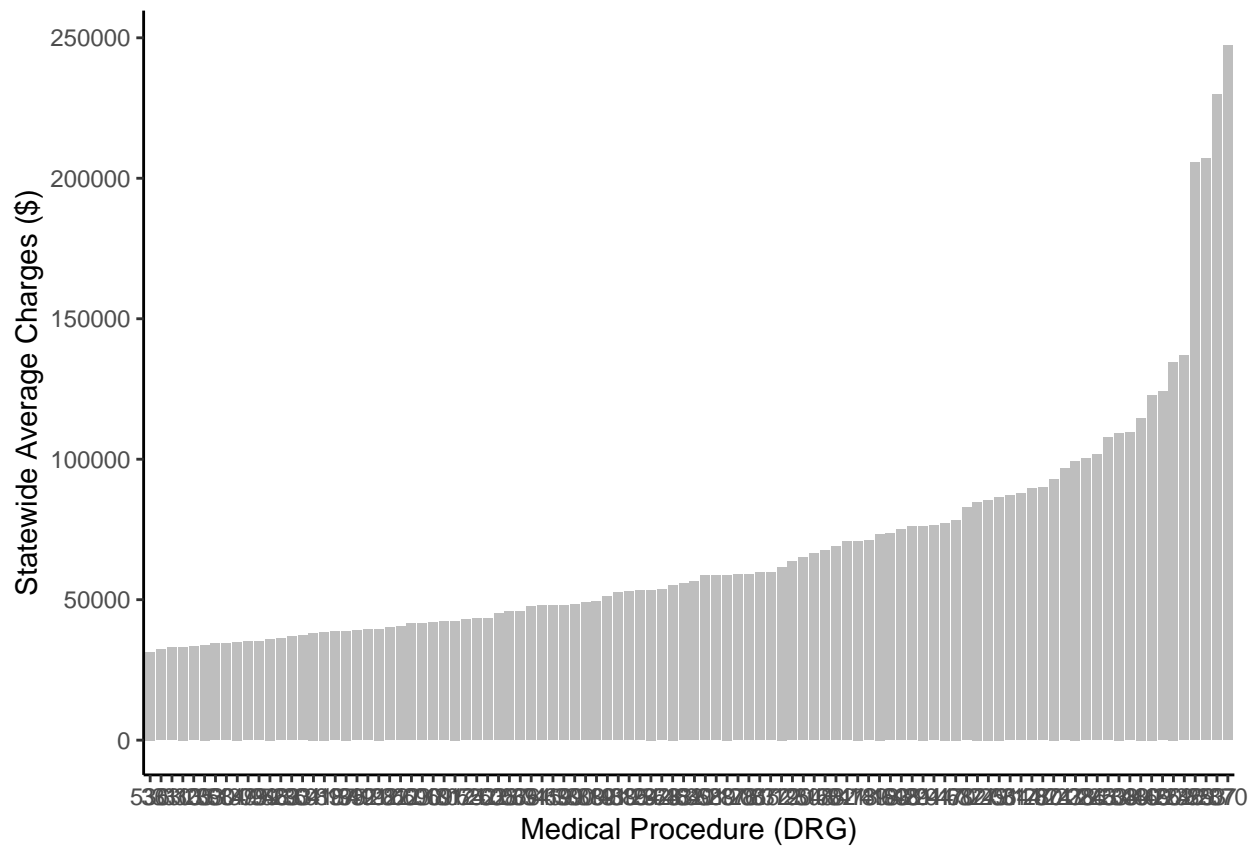

# print the plot
p
```

- 2.2 Replace `x = drg` with `x = reorder(drg, mean_charge)`, but also remove the `theme()` line. Now what happens? What was the purpose of the `theme()` line? *Hint: You may need to knit the document and look at the pdf to better observe what's happening.*

The purpose of the `theme` line was to rotate the x-axis labels 90 degrees. When I removed the `theme` line, the x-axis is much more difficult to read.

```
p <- ggplot(
  data = ChargesNJ,
  aes(x = reorder(drg, mean_charge), y = mean_charge)
) +
  geom_col(fill = "gray") +
  ylab("Statewide Average Charges ($)") +
  xlab("Medical Procedure (DRG)")
p
```

**Problem 3 Historical baby names** As you read through (or, even better, as you code along with. . .) the extended example on historical baby names in Section 3.3.1, write down two questions you have about any of the R code used in that example. Your questions could be about what a specific part of the code—ggplot or not—is actually doing, or a more general question about any of the commands used. Please be thoughtful about your questions; we will use them (anonymously) in an exercise in class this week.

1. I am not too familiar with probability. Why would setting the probability to 0.5 give us the median?
2. I would like to learn how to better use the `%>%` function and how that differs from a pipe operator.

```
BabynamesDist <- make_babynames_dist()

joseph <- BabynamesDist %>%
  filter(name == "Joseph" & sex == "M")
name_plot <- ggplot(data = joseph, aes(x = year))

name_plot <- name_plot +
  geom_col(
    aes(y = count_thousands * alive_prob),
    fill = "#b2d7e9",
    color = "white",
    size = 0.1
  )

name_plot
```
